

How the Discern Verity Scorecard Works

Methodology

What the score is

Every driver gets a **safety score from 0 to 100**, recomputed weekly from the telematics the fleet already runs — Samsara, Motive, Geotab, or any system that exports events and mileage. **No new hardware, no new subscriptions.**

How it's computed — four steps

1. **Normalize by exposure.** Raw event counts punish the drivers who work the most. Every event type is converted to a **rate per 1,000 miles**, so a driver running 2,800 miles a week is compared fairly against one running 900.
2. **Weight by severity.** Not all events predict a claim equally. Each rate is multiplied by a severity weight before scoring:

EVENT TYPE	WEIGHT
Harsh braking / acceleration / cornering	1.0
Following distance	1.5
Speeding (by band over limit)	2.0 / 4.0 / 8.0
Mobile device usage	8.0

Distracted driving and severe speeding carry the heaviest weights because they are the strongest predictors of serious loss.
3. **Rolling window.** Scores use a **rolling 4-week window**, so the number reflects how a driver is driving *now* — one bad day fades with sustained improvement, and a good week doesn't erase a bad month.
4. **Score curve.** The weighted rate maps to the 0–100 score on an exponential curve, so small increases in risky behavior move the score sharply. Problems surface **early** — while they're still coaching items, not claims. *(For the technically inclined: $score = 100 \times e^{(-weighted\ rate / 138)}$, with contextual adjustments for night driving and high-risk corridors.)*

What comes out of it

- A **3-page fleet scorecard** — fleet trend, driver leaderboard, coaching priorities, corridor and night-driving exposure
- **Driver-level drill-downs** and a dated coaching log as behavior changes
- An **underwriter-ready renewal packet** assembling all of it into the account's loss story

Why underwriters take it seriously

- **Consistent and reproducible** — the same math runs every week; nothing is cherry-picked for renewal season.
- **Leading indicators, not lagging ones** — behavior data moves months before claims data does.
- **Maps directly to schedule-rating factors** — driver quality, safety organization, and management are exactly what schedule credits are written against.

Data handling

The fleet's data stays the fleet's. Analysis runs independently, on the fleet's side of the table — nothing is shared with any carrier, program, or market until the fleet approves the packet.

Current sample scorecard uses demonstration data: a synthetic fleet modeled on industry benchmark event rates.
