

The Renewal Move: Three Layers That Stack

The renewal move: three layers that stack

Most fleets get at most one of these. The point of the engagement is that all three land at the **same renewal** — and they compound, because each layer makes the next one easier to get.

Layer 1 — A better loss story (the foundation)

- Driver scorecards and a documented coaching program, built from the cameras and ELDs the fleet **already runs**. No new hardware.
- Dated, week-by-week evidence that risk is identified, assigned, and falling — *before* the underwriter asks.
- **What it changes:** the account stops being priced on the industry's trend and starts being priced on its own record.

Layer 2 — Scheduled underwriting credits

- Underwriters can apply **schedule-rating credits** for a documented, consistently-run safety program — but only when someone hands them the documentation.
- The renewal packet is written for the underwriter: methodology, driver trends, coaching log, corridor and night-driving exposure.
- **What it's worth:** commonly up to 25% in schedule credits, varying by carrier and state.

Layer 3 — Carrier telematics program discounts (pick the door that matches the carrier)

PROGRAM	WHAT IT PAYS	WORTH KNOWING
Northland (Travelers) telematics	Premium discount <i>or</i> per-vehicle device subsidy	Data shared via TruckerCloud (Samsara, Motive, Netradyne, Azuga); Northland states it isn't used for rating
Progressive Smart Haul	Avg. \$1,261 first-year savings (ELD-based)	Progressive's separate dashcam discount closed to new enrollment July 1, 2026 — Smart Haul is the door still open
Nationwide Vantage 360 Fleet	10% on select coverages	Free app + tag telematics
Nirvana	Up to 20% up front	Prices off the fleet's historical Samsara/Motive data — a clean data story pays immediately; ~25% off Samsara hardware as a perk
HDVI Shift	Up to 20%, repriced monthly	Runs a 90-day telematics "lookback" at quote — the score walking in <i>is</i> the price
Cover Whale	Up to 30% at renewal	Continuous dashcam underwriting; fits newer authorities

What it adds up to

Example at real size: a 42-truck fleet facing a \$552K renewal. Layer 1 reframes the account, Layer 2 earns schedule credits, Layer 3 stacks the program discount → **~\$497K, a 10% swing** — roughly \$55K the fleet keeps, for an engagement that costs a fraction of that.

Why none of this happens on its own

- Telematics programs reward **sharing** data, not **improving** it — the discount arrives whether or not the loss trend does.
- Underwriting credits require documentation that nobody at a 10–100 truck fleet has time to build.
- Turning both into a shopped renewal is the broker's play — the analytics packet is what arms it.

Discern Verity — Independent Fleet Risk Analytics. Works for the fleet, not for any carrier. The fleet's data is analyzed first, on the fleet's side of the table — nothing is shared with any market until the fleet approves the packet.
